

PAN Handling in Air Booking Flow

Overview

For certain air bookings, providing a valid Permanent Account Number (PAN) is mandatory. PAN applicability is communicated during the review stage and must be honored during Hold or Book requests.

PAN Applicability Indicator

The Air Review API response includes a boolean field named **ipa** that indicates whether PAN is required.

Field	Type	Description
ipa	boolean	Indicates if PAN is mandatory for the booking

Values: true → PAN required, false → PAN not required

Instant Booking Flow (Air Book API)

When **ipa** is true, a valid PAN must be provided in the Air Book request payload.

Field	Type	Mandatory	Description
pan	string	Yes (if ipa = true)	Valid Indian PAN

Example: "pan": "XSDTW6829M"

Hold Booking Flow (Hold API)

When **ipa** is true, a valid PAN must be provided in the Hold API request payload.

Field	Type	Mandatory	Description
pan	string	Yes (if ipa = true)	Valid Indian PAN

Example: "pan": "XSDTW6829M"

PAN Validation Behavior

If PAN validation fails, the booking is moved to a Pending state. No explicit error message is returned in the API response under the current flow.

Passenger Data Applicability

Passenger information, including PAN, follows the same structure for one-way, return, and multi-city bookings. The sample payloads are applicable across all journey types.
